ACKNOWLEDGEMENT

We have taken efforts in this project. However, it would not have been possible without the kind support and help of many individuals. We would like to extend our sincere thanks to all of them. We are highly indebted to Swastik College for their guidance and constant supervision as well as for providing necessary information regarding the project & also for their support in completing the project. We would like to express our gratitude towards our teachers for their kind cooperation and encouragement which helped us in completion of this project. A huge thanks and appreciations also go to the team members in developing the project and people who have willingly helped us out with their abilities.

ABSTRACT

The project is a fake news detection system that identify whether the news is real or fake with the help of model that we create. The project involves different steps including data preprocessing and cleaning, implementing classification, clustering, association algorithms in any programming language, and data visualization through data mining tools. Different news articles are published 24/7. In short, almost 52 % of them are not even real. Hence this project is aimed to achieve the highest news detection of all readers.

TABLE OF CONTENTS

1. Dependencies	1
2. Preprocessing and Cleaning	1
3. Implementing Classification	3
4. Clustering	7
5. Association Algorithm	9
6. Data visualization / Evaluation	10
7. Making a Predictive System	11
8. Conclusion	12
9. References	13
